

CLAIMS

What is claimed is:

- 1 1. A magnetic head having an air bearing surface (ABS), comprising:
2 a magnetomechanically active structure; and
3 a coil coupled to the magnetomechanically active structure, the
4 magnetomechanically active structure responding to a magnetic field
5 generated by the coil to expand and/or contract.

- 1 2. A magnetic head as recited in claim 1, wherein the magnetomechanically active
2 structure is generally toroid shaped.

- 1 3. A magnetic head as recited in claim 1, wherein the magnetomechanically active
2 structure includes at least two layers.

- 1 4. A magnetic head as recited in claim 1, wherein a magnetization of the
2 magnetomechanically active structure is set parallel to the ABS, the
3 magnetomechanically active structure inducing protrusion of the head into the
4 ABS in response to the magnetic field generated by the coil.

- 1 5. A magnetic head as recited in claim 1, wherein a magnetization of the
2 magnetomechanically active structure is set at an angle between about 0 and about

3 90 degrees with respect to the ABS, the magnetomechanically active structure
4 inducing protrusion of the head towards the ABS in response to the magnetic field
5 generated by the coil when current is passed through the coil in a first direction,
6 the magnetomechanically active structure inducing contraction of the head away
7 from the ABS in response to the magnetic field generated by the coil when current
8 is passed through the coil in a second direction opposite the first direction.

1 6. A magnetic head as recited in claim 5, wherein a magnetization of the
2 magnetomechanically active structure is set at an angle between about 30 and
3 about 60 degrees with respect to the ABS, the magnetomechanically active
4 structure inducing protrusion of the head towards the ABS in response to the
5 magnetic field generated by the coil when current is passed through the coil in a
6 first direction, the magnetomechanically active structure inducing contraction of
7 the head away from the ABS in response to the magnetic field generated by the
8 coil when current is passed through the coil in a second direction opposite the first
9 direction.

1 7. A magnetic head as recited in claim 1, wherein a portion of the
2 magnetomechanically active structure positioned away from the ABS is anchored.

1 8. A magnetic head as recited in claim 7, further comprising a first material for
2 anchoring the portion of the magnetomechanically active structure positioned
3 away from the ABS, and a second material coupled to the magnetomechanically

4 active structure towards the ABS, the second material having a lower Young's
5 modulus than the first material.

1 9. A magnetic head as recited in claim 8, further comprising a third material
2 positioned between the magnetomechanically active structure and the second
3 material, the third material having a coefficient of thermal expansion similar to
4 that of the second material.

1 10. A magnetic head as recited in claim 7, further comprising a first material for
2 anchoring the portion of the magnetomechanically active structure positioned
3 away from the ABS, and a second material coupled to the magnetomechanically
4 active structure away from the ABS, the second material having a lower Young's
5 modulus than the first material.

1 11. A magnetic head as recited in claim 10, further comprising a third material
2 positioned between the magnetomechanically active structure and the second
3 material, the third material having a coefficient of thermal expansion similar to
4 that of the second material.

1 12. A magnetic head as recited in claim 1, further comprising a layer of material
2 coupled to the magnetomechanically active structure, the third material having a
3 coefficient of thermal expansion similar to that of a material of the head
4 operatively coupled thereto.

- 1 13. A magnetic head as recited in claim 1, further comprising a layer of material on
2 an opposite side of at least one of a read element and a write element with respect
3 to the ABS, the layer of material having a Young's modulus lower than a majority
4 of materials surrounding the layer of material.
- 1 14. A magnetic head as recited in claim 13, further comprising second and third
2 layers of material extending from the layer of material towards the ABS, the
3 second and third layers of material having a Young's modulus lower than a
4 majority of materials surrounding the second and third layers of material.
- 1 15. A magnetic head as recited in claim 1, wherein the magnetomechanically active
2 structure is positioned between a read element and a write element of the head.
- 1 16. A magnetic head as recited in claim 1, wherein the magnetomechanically active
2 structure is positioned on an opposite side of a read element of the head with
3 respect to a write element of the head.
- 1 17. A magnetic head as recited in claim 1, wherein the magnetomechanically active
2 structure is positioned on an opposite side of a write element of the head with
3 respect to a read element of the head.

- 1 18. A magnetic head as recited in claim 1, wherein the magnetomechanically active
2 structure contracts upon detection of a thermal asperity on the disk surface.
- 1 19. A slider having a magnetic head, the magnetic head having an air bearing surface
2 (ABS), the slider comprising:
3 a magnetomechanically active structure; and
4 a coil coupled to the magnetomechanically active structure, the
5 magnetomechanically active structure responding to a magnetic field
6 generated by the coil to expand and/or contract.
- 1 20. A magnetic storage system, comprising:
2 magnetic media;
3 at least one head for reading from and writing to the magnetic media, each head
4 comprising:
5 a magnetomechanically active structure; and
6 a coil coupled to the magnetomechanically active structure, the
7 magnetomechanically active structure responding to a magnetic
8 field generated by the coil to expand and/or contract;
9 a slider for supporting the head; and
10 a control unit coupled to the head for controlling operation of the head.
- 1 21. A magnetic storage system as recited in claim 20, further comprising a thermal
2 asperity detector coupled to the at least one head, wherein the

- 3 magnetomechanically active structure of the head contracts upon detection of a
- 4 thermal asperity on the disk surface.
